

Style Modes

defined constants

#include <TextEdit.h>

Constant	Value	Description/Sample
<u>doFont</u>	0x01	set/query font number
<u>doFace</u>	0x02	set/query character style (bold, italic, et al.)
<u>doSize</u>	0x04	set/query size
<u>doColor</u>	0x08	set/query RGB color
<u>doAll</u>	0x0F	set/query font, style, size, and color
<u>addSize</u>	0x10	increment/decrement font size (TESetStyle only)
<u>doToggle</u>	0x20	(with <u>doFace</u>) either set the attribute, or turn it off, depending upon if it is continuous across the range (supported starting with system 6.0)

These constants are used in **TESetStyle**, **TEReplaceStyle**, and **TEContinuousStyle**.

They are bit values and may be used in combination to modify the nature of your request. These values apply to fields of the TextStyle data structure (which see).

The doToggle variation is designed to be used with the doFace mode on calls to **TESetStyle**. It automates a standard action of applying or removing a face attribute (italics, bold, etc) across a selection range which contains a variety of attributes. See **TESetStyle** for an example.

See **TextEdit With Style** for related information.
