
Enhancements to International Resources

System software version 7.0 provides several enhancements to the international resources, including the following:

- The 'itlc' resource specifies a region code that identifies a particular localized version of the Macintosh system software.
- The 'itlm' resource (new with system software version 7.0) specifies the ordering of script codes, language codes, and region codes and the hierarchical arrangement of these codes.
- The 'itlb' resource specifies font and style information for the script as well as other script initialization data.
- The 'itl1' resource can be optionally extended to include additional day and month names, abbreviated day and month names, additional date separators, and a calendar code.
- The 'itl2' resource includes length information so that tables (specifically the **FindWord** tables and the optional **FindScriptRun** table) and code blocks now have a length as well as an offset.
- The optional 'itl5' resource (new with system software version 7.0) supplies character set encoding data and information on text rendering behavior. With the exception of the optional 'itl5' resource, these enhancements are described in the sections that follow.
