
TextEdit and TrueType Fonts

If your application is using a TrueType font, the default behavior of the **Font Manager** is to ensure that glyphs fit within the font's ascent and descent. Glyphs that extend beyond the ascent or descent, such as certain accented fonts, are scaled down to fit. If your application has set the *preserveGlyph* parameter of the **SetPreserveGlyph** procedure to TRUE to preserve the original unscaled shape of the glyph, **TextEdit** sets it to FALSE before it calls **DRAWHook** to perform any drawing. This is to guarantee that the glyphs whose bounding boxes exceed the font's ascent or descent are scaled down to prevent them from colliding with other glyphs on the lines above or below. **TextEdit** then restores the *preserveGlyph* parameter to its previous value before proceeding. See **DRAWHook** for details.
