**Setting and Checking System Variables**

The **GetDefFontSize**, **GetSysFont**, **GetAppFont**, **GetMBarHeight**, and **GetSysJust** routines return the most recent values of given (low-memory) global variables. **SetSysJust** sets the global variable that represents the default line direction for the system.

<b><u>GetDefFontSize</u></b>	Returns the size of the current default font
<b><u>GetSysFont</u></b>	Returns the identification number of the current system font
<b><u>GetAppFont</u></b>	Returns the identification number of the current application font
<b><u>GetMBarHeight</u></b>	Returns the height of the menu bar required to hold menu titles in the current system font. This routine is useful for calculating window size or dragLimit rect
<b><u>GetSysJust</u></b>	Returns the value of <b><u>TESysJust</u></b> , the global variable that represents the default line direction (left to right or right to left) for text in the system script
<b><u>SetSysJust</u></b>	Sets the value of <b><u>TESysJust</u></b> (see the description of <b><u>GetSysJust</u></b> for a description of <b><u>TESysJust</u></b> )
